REVISED FARM WAGE RATE SERIES

Revised statistics on farm wage rates by States, 1910-1948, are presented in this publication. The revisions are largely due to changes in methods of weighting. Revisions for geographic regions and for the United States were released in the December 1950 issue of "Farm Labor." States data for 1948, 1949 and 1950, using 9 types of wage rates are presented in "Farm Labor" for January 1951.

Data on wage rates paid to hired workers are weighted by the estimated number of workers receiving various rates, in calculating United States averages. Composite rates (the weighted average of all rates) are weighted by the proportion of workers receiving each rate. The data used for these weights in the unrevised composite series were obtained from a 1927 survey and were available only for the year as a whole. Therefore, the old series used a constant set of proportions for each of the quarterly periods for which wage rates were reported. In the revised series, data were used from interview surveys made in March, May and September 1945, July 1946 and January 1947. These surveys made it possible to set up a different set of proportions for each of the wage rate periods.

The proportions of workers paid different rates, as obtained from the interview surveys, have been used for the 1944 to 1949 wage rate series. The proportions for the period 1923 to 1944 were derived by interpolation, on the basis of data from the 1927 survey and the data used in 1944.

In addition to using new proportions for workers paid different types of wage rates, the revised wage rate series use revised estimates of hired farm employment for the period 1931-1949.

Minor changes in the composite wage rates and the indexes for the 1910-1922 period have also been made. A re-examination in 1945 of State data for the years 1922 and 1923, when the annual average series was replaced by quarterly estimates, revealed that the annual average series was not quite comparable with later data. Revisions of the annual average State rates for 1910-22 were made and published in 1945. However, the revised State estimates were not reweighted at that time to obtain new regional and United States averages. It was not believed desirable to change the national data at that time, when a general reweighting of the entire series was being planned.

1/ Daily rates converted to monthly equivalents, monthly rates and monthly equivalents of daily rates weighted by the estimated percentage of workers receiving each type of rate.
2/ Based on average rate, 1910-14=100. Adjusted for seasonal variation.
